EnteroGast acute

Dietetic complementary feed for cats and dogs. For the reduction of acute intestinal absorptive disorders. During periods of and recovery from acute diarrhoea.

Only available at your veterinary practice

EnteroGast acute

For the reduction of acute intestinal absorptive disorders. During periods of and recovery from acute diarrhoea.

EnteroGast acute promotes the solidification of the feces even when administered in small doses. It supports the gut function in three phases. Firstly, the astringent properties of ratanhia and oak prevents too much fluid from entering the intestine. Secondly, Psyllium husks bind free liquid, thereby solidifying the feces. The final component of EnteroGast acute, the gut bacteria *Enterococcus faecium*, promotes the build-up of healthy intestinal flora. EnteroGast acute in powder form is easy to mix into food and administer – perfect for cats and dogs that refuse tablets. EnteroGast acute powder contains no added flavorings and is suitable for animals suffering from allergies.

Ingredients (excerpt)

Enterococcus faecium (Probiotic bacterial cultures)

Probiotic cultures such as the *Enterococcus* strain exert an inhibitory effect on pathogenic intestinal bacteria. The cultures influence the binding ability of these intestinal bacteria by altering the luminal pH. Competition between probiotics and pathogenic bacteria for binding sites on the intestinal epithelium contributes towards the inhibitory effect: unwanted microorganisms are ousted in favor of the natural intestinal flora.

Oak bark (*Quercus robur cortex*)

Pedunculate oak bark is rich in tanning agents that have an astringent effect, making the intestinal mucosa denser. This leads to less water being released into the gut, helping the intestinal contents to return to its normal, firm form.

Ratanhia root dried and ground

Similar to oak bark, rhatany roots contain a large amount of tannins (mainly catechols and proanthocyanides).

Psyllium (*Plantago ovata*)

The husk of the Indian psyllium has a strong natural swelling effect. The seed can absorb up to 40 times its own weight in water. Once in contact with water, it forms a protective layer of mucus. This coats the lining of the stomach and esophagus like a film. In the intestine, psyllium husks bind excessive fluid. The feces is thus bound and stays in the intestine longer. This endures that the feces is consolidated and their output regulated naturally.
